# 1. Software and hardware platform description

Module: 3.5-inch ESP32-32E display module with 320x480 resolution and ST7796

screen driver IC.

Module master: ESP32-WROOM-32E module, the highest main frequency 240MHz,

support 2.4G WIFI+ Bluetooth.

Thonny version: 4.1.6

ESP32 MicroPython firmware version: 1.23.0.

## 2. Pin allocation instructions

Figure 2.1 Rear view of 3.5-inch ESP32-32E display module

The main controller of the 3.5-inch ESP32 display module is ESP32-32E, and the

GPIO allocation for its onboard peripherals is shown in the table below:

ESP32-32E pin allocation instructions							
On board device	On board device pins	ESP32-32E connection pin	description				
	TFT_CS	IO15	LCD screen chip selection control signal, low level effective				
LCD	TFT_RS	102	LCD screen command/data selection control signal.High level: data, low level: command				

				SPI bus clock sig	nal (shared by LCD	
		TFT_SCK	IO14	screen and touch screen)		
		TFT_MOSI	1012	SPI bus writes data signals (shared by LCD		
			1013	screen and touch screen)		
		TET MISO	1012	SPI bus reading data signal (shared by		
			1012	LCD screen and touch screen)		
			EN	LCD screen reset control signal, low level		
		TFT_RST		reset (shared reset pin with ESP32-32E		
				main control)		
			IO27	LCD screen backlight control signal (high		
		IFI_BL		evel lights up the backlight, low level turns		
				SPI bus clock sig	nal (shared by touch	
		TP_SCK	IO14	screen and LCD	screen)	
				SPI bus writes data signals (shared by		
		TP_DIN	1013	touch screen and LCD screen)		
			1012	SPI bus reading data signal (shared by		
	RTP	IP_DOUT	1012	touch screen and LCD screen)		
		TP_CS TP_IRQ	1033	Resistance touch screen chip selection		
			1000	control signal, low level effective		
			IO36	Resistive touch screen touch interrupt		
				signal, when a touch is generated, input a		
				low level to the m		
		LED_RED	1022	Red LED light	RGB tri color LED light,	
	LED	LED GREEN	1016	Green I ED light	with a common anode,	
			1010		lit at low level and	
		LED_BLUE	IO17	Blue LED light	turned off at high level.	
	SDCARD					
		SD_CS	105	SD card signal se	election, low level effective	
		SD_MOSI	1023	SD card SPI bus write data signal		
		SD_SCK	IO18	SD card SPI bus clock signal		
		SD_MISO	1019	SD card SPI bus read data signal		
			1010			
	BATTERY	BAT_ADC	IO34	Battery voltage ADC value acquisition signal (input)		
	Audio	Audio ENABLE	104	Audio enable signal, low-level enable,		
				high-level disable		
		Audio_DAC	IO26	Audio signal DAC output signal		
	KFY	BOOT KEY	100	Download mode selection button (press		
		BOOT_KET	100	and hold the button to power on, then		

			release it to enter download mode)		
		EN	ESP32-23E reset button, low level reset		
	RESET_RET	EIN	(shared with LCD screen reset)		
Carial Dant	RX0	RXD0	ESP32-32E serial port receiving signal		
Serial Port	ТХО	TXD0	ESP32-32E serial port sends signal		
POWER	TYPE-C_POWER	/	Type-C power interface, connected to 5V voltage.		

Table 2.1 Pin allocation instructions for ESP32-32E onboard peripherals

### 3. Instructions for the example program

#### 3.1. Set up ESP32 MicroPython development environment

For detailed instructions on setting up the

"MicroPython\_development\_environment\_construction\_for\_ESP32", please

refer to the document.

#### 3.2. Upload files

After the development environment is set up, the relevant files need to be

uploaded to the ESP32 device in order to run the testing program.

Before uploading the file, please familiarize yourself with the directory contents of the MicroPython sample program. Open the "1-示例程序\_Demo\MicroPython"

directory in the package, as shown in the following figure:

Figure 3.1 MicroPython Example Program Catalog

The contents of each folder are described as follows:

**BMP**: Stores BMP format images that sample programs need to use.

demos: Contains sample programs

firmware: Stores MicroPython firmware (needs to be burned when setting up the development environment)

Font: Stores the Chinese and English character modulo data that the sample program needs to use.

libraries: Stores MicroPython library files that sample programs need to use

After understanding the directory contents of the MicroPython sample program,

the next step is to upload the program file to the ESP32 device. The steps are as follows:

- A. Connect the ESP32 display module to the computer and power it on using a USB cable.
- B. Open the Thonny software and configure the MicroPython interpreter for ESP32, as shown in the following figure:

The Thonny

File Edit View Run Tools Help

(If already configured, this step can be omitted)

Figure 3.2 Selecting MicroPython interpreter

C. Click the toolbar

button to connect the ESP32 device. If the following

prompt appears in the shell information bar, it indicates that the device connection

is successful.

Figure 3.3 Connecting ESP32 devices

D. Click the "View ->Files" button to open the file window (ignore this operation if it is already open). Find the "1-示例程序\_Demo\MicroPython" directory in the package in the window, left click the mouse to select the target file in the directory, and right-click on the standalone mouse to select "Upload to /" to upload the target file. As shown in the following figure:

Please note that when uploading files, ESP32 cannot run any programs, otherwise the upload will fail

Figure 3.6 Example Program

The sample program can be uploaded to an ESP32 device to open and run, or it can be opened and run on a local computer. If you need to power on the ESP32 display module to run automatically, you need to change the sample program name to "**main. py**" and upload it to the ESP32 display module.

In the Python software, open the target sample program, click the menu bar

button, and you can run it. If the operation fails, the ESP32 device needs to be reconnected.

The introduction of each example program is as follows:

#### BMP\_test.py

This example program relies on the ST7796.py library to display images in

BMP format

#### font\_test.py

This example program relies on the ST7796.py library to display Chinese and English characters of various sizes. The font modeling data needs to be saved in the font file according to the relevant format. For instructions on character casting, please refer to the following website:

http://www.lcdwiki.com/Chinese\_and\_English\_display\_modulo\_settings

#### graphical\_test.py

This example program relies on the ST7796.py library to display graphics such as points, lines, rectangles, rounded rectangles, triangles, circles, ellipses, etc. for drawing and filling, as well as setting display orientation.

#### Read\_ID\_GRAM.py

This example program relies on the ST7796.py library to display LCD ID and RGAM color value readings.

#### RGB\_LED.py

This example hardware requires the use of RGB tri color lights to display the on/off and brightness adjustment of the RGB tri color lights.

#### Simple\_test.py

This example does not rely on any software libraries and displays simple screen scrolling content.

#### Touch\_Calibrate.py

This example relies on the ST7796.py library and the touch.exe library, displaying the calibration of a resistive touch screen. Follow the prompts displayed on the screen. After calibration is completed, the calibration parameters are output through the serial port and copied to the initialization of the sample program. Please note that the touch screen should be calibrated according to the display direction. The display direction in this program can be modified, as shown in the following figure:

if	name=='main':
	coord = [0xFFFF, 0xFFFF]
	val = [0, 0, 0, 0, 0, 0, 0, 0]
	mylcd.LCD_Set_Rotate(1)
	<pre>mylcd.LCD_Clear(0)</pre>
	<pre>mylcd.Show_String((mylcd.lcd_width - 208) // 2, (mylcd.lcd_height-16) /</pre>
	<pre>for i in range(4):</pre>
	mylcd.Fill Rect(0, 0, mylcd.lcd width, 16, 0)
	mylcd.Fill Rect(0, mylcd.lcd height-16, mylcd.lcd width, 16, 0)
	switch = {
	0: case 0,
	1: case 1,
	2: case_2,

#### Figure 3.7 Modifying the Touch Calibration Display Direction

#### Touch\_Pen.py

This example relies on the ST7796.py library and the touch.exe library,

displaying the operation of drawing dots and lines on the touch screen.
